Notes:
Plug Seq.: Pin engagement sequence during hot plugging.

1) TX Fault is an open collector output, which should be pulled up with a $4.7 \mathrm{k} \mathrm{\sim 10k} \mathrm{\Omega}$ resistor on the host board to a voltage between 2.0 V and $V c c+0.3 \mathrm{~V}$. Logic 0 indicates normal operation; Logic 1 indicates a laser fault of some kind. In the low state, the output will be pulled to less than 0.8 V .
2) TX Disable is an input that is used to shut down the transmitter optical output. It is pulled up within the module with a $4.7 \mathrm{k} \sim 10 \mathrm{k} \Omega$ resistor. Its states are:
Low (0 to 0.8V): Transmitter on
( $>0.8 \mathrm{~V},<2.0 \mathrm{~V}$ ): Undefined
High (2.0 to 3.465V): Transmitter Disabled
Open: Transmitter Disabled
3) Mod-Def 0,1,2. These are the module definition pins. They should be pulled up with a $4.7 \mathrm{k} \sim 10 \mathrm{k} \Omega$ resistor on the host board. The pull-up voltage shall be VccT or VccR.
Mod-Def 0 is grounded by the module to indicate that the module is present
Mod-Def 1 is the clock line of two wire serial interface for serial ID
Mod-Def 2 is the data line of two wire serial interface for serial ID
4) LOS is an open collector output, which should be pulled up with a $4.7 \mathrm{k} \sim 10 \mathrm{k} \Omega$ resistor. Pull up voltage between 2.0 V and $V c c+0.3 \mathrm{~V}$. Logic 1 indicates loss of signal; Logic 0 indicates normal operation. In the low state, the output will be pulled to less than 0.8 V .
5) RD-/+: These are the differential receiver outputs. They are internally AC-coupled 100 differential lines which should be terminated with $100 \Omega$ (differential) at the user SERDES.
6) TD-/+: These are the differential transmitter inputs. They are internally AC-coupled, differential lines with $100 \Omega$ differential termination inside the module.
